

Input

Q: Alex, Stan, and Adelwolfe are trying to catch them all, Pokemon that is. Together they have caught 339 Pokemon. Alex has caught 5 more than Stan, and Stan has caught 13 less than 4 times as many as Adelwolfe has caught. How many Pokemon has Stan caught?

CoT

LLM (Parse + Plan + Execute)

Let X be the number of Pokemon Stan has caught. Alex has caught 5 more than Stan, so Alex has caught X + 5.

Stan has caught 13 less than 4 times as many as Adelwolfe has caught, so Stan has caught $4X - 13$. Together they have caught 339 Pokemon, so $X + 5 + 4X - 13 = 339$.

Combining like terms produces $5X + 5 = 339$. Subtracting 5 from both sides produces $5X = 334$. Dividing both sides by 5 produces $X = 66.80$, so Stan has caught 66 Pokemon.

The answer is 66. ❌

ProgramLM

LLM (Parse + Plan)

```
total_pokemon = 339
alex_pokemon = 5
stan_pokemon = 4
adelwolfe_pokemon = 13
stan_pokemon = (total_pokemon -
alex_pokemon - adelwolfe_pokemon *
stan_pokemon) / (1 - stan_pokemon)
result = stan_pokemon
```

↓ Program

Interpreter (Execute)

result = -94 ❌

SatLM

LLM (Parse)

```
total_pokemon = 339
stan_pokemon = Variable()
alex_pokemon = stan_pokemon + 5
stan_pokemon = adelwolfe_pokemon * 4 - 13
total_pokemon = alex_pokemon + stan_pokemon +
adelwolfe_pokemon
result = stan_pokemon
solve(result)
```
